QTrust 2go Smart

Secure Application Access

QTrust 2go Smart integrates the person's physical identity into the security concept when accessing data, in accordance with QGroup's IT Security Strategy 2.0. Based on our QTrust products, we have developed a solution that allows end customers to carry out secure authentication when using a smartphone to access specific business areas and applications.

The smartphone represents a separate authentication channel in this process – the data and applications are released after you enter your user name and a one-time password. To generate this one-time password, you use your phone's camera to load a 2D barcode that is displayed on the screen. A biometric input is the 3rd identification factor: final authentication is by means of facial recognition. This version of QTrust 2go Life, which uses a smartphone instead of the QTrust 2go Life Token, guarantees convenient and secure use of the enabled areas. You can integrate any commercially available smartphone into the QTrust 2go Smart authentication process.

The accessible data and applications are in the computer center and are secured by means of the PitBull Trusted Operating System that runs on the QTrust Server. Using PitBull prevents the unauthorized flow of data between logged-in users.

QTrust 2go is simple

- Simple handling for end users
- Simple administration processes
- Does not require installation
- Can be integrated into existing VPN solutions

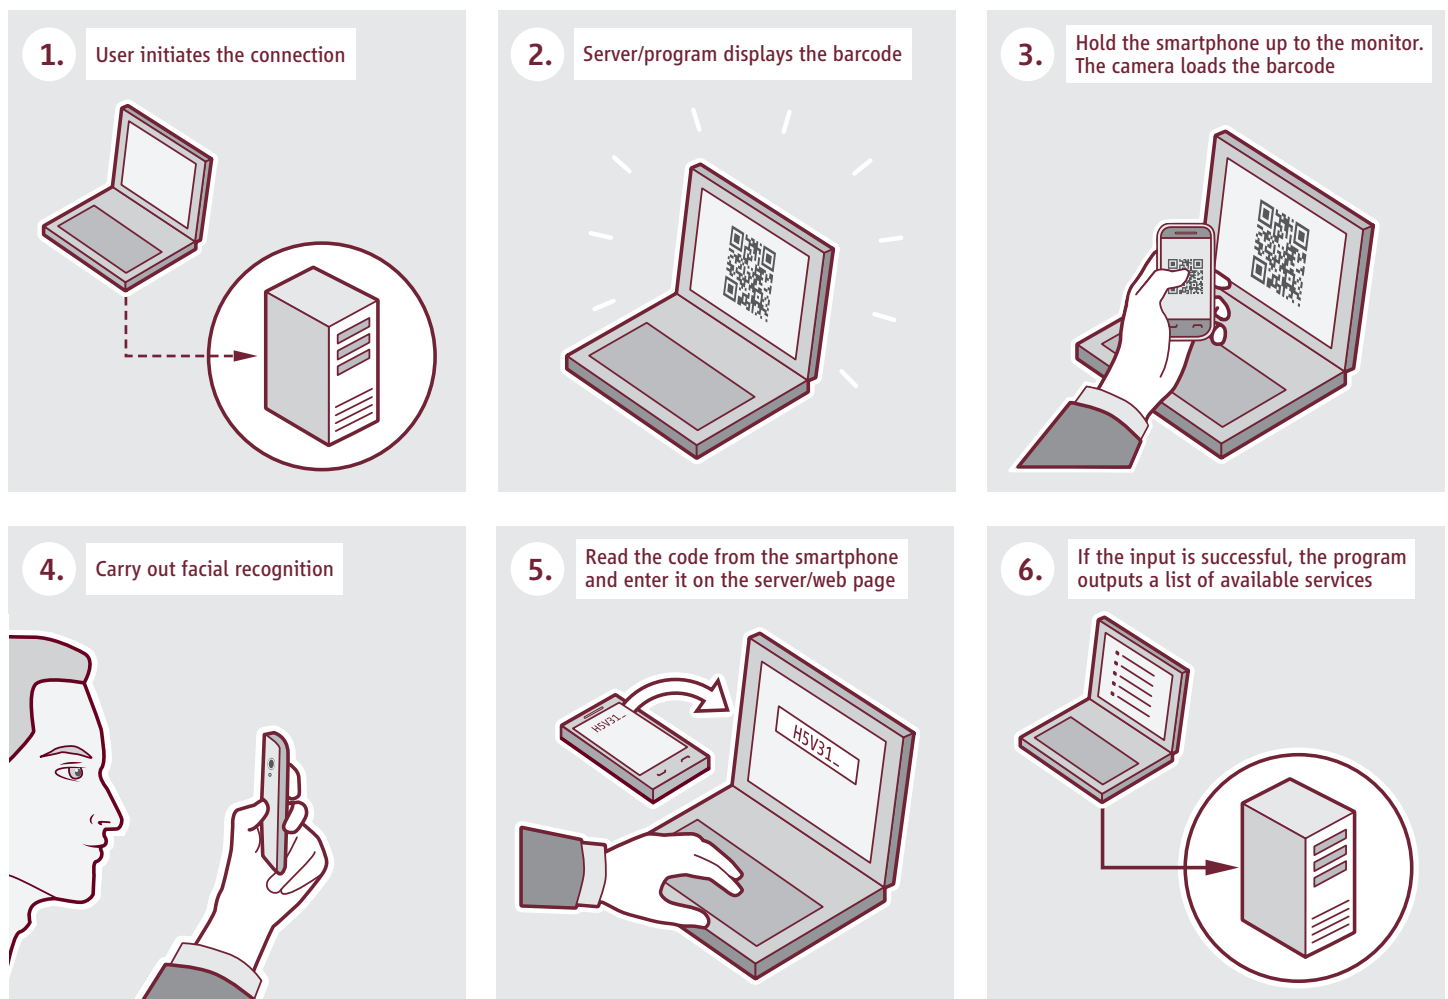

QTrust 2go is secure

- A unique physical identity is ensured by biometric data
- A three-stage security process
- No phishing, no bugging
- Includes silent alarm
- Based on the QTrust Server with PitBull – the certified Trusted Operating System

QTrust 2go is available

- Immediate use with existing applications (with no customizing)
- Can be used everywhere on an equipment-independent basis
- Platform-independent – clients for Windows, Mac OS X, iPad®, iPhone®
- Thin Client Support

simple. secure. available.
